

Same proposed MCP operation c_t + static policy

Illustrative order-sensitive lifecycle example

B1 can receive byte-identical inputs only when current call and the complete locked non-order projection are identical.

B2 retains the transition order and can distinguish lifecycle evolution; final permission states and independent labels may still agree.

Validity first: a post-revoke USE requires a valid available / NEW grant for its exact scope.
The synthetic observation override has an empty selection and generates no USE.
These strings alone establish neither valid matching nor opposite labels.
Independent fixture / oracle labels determine whether the distinction is correct.
